                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       encoding human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human tumour necrosis factor receptor (TNFR)-
Galpha and 6beta protein and their corresponding nucleic acids. The
invention provides screening methods for identifying agonists and
antagonists of TMFR-6alpha and 6beta activity. The invention also
provides diagnostic and therapeutic methods for detecting and treating
immune system-related disorders. The method is useful for treating or
preventing an inflammatory disease or disorder selected from bowel
disease, encephalitis, atherosclerosis and psoriasis, an autoimmune
disease or disorder selected from systemic lupus erythematosus,
arthritis, rheumatorid arthrils, multiple sclerosis, Crohn's disease,
and autoimmune encephalitis, graft versus host disease (GVHB), and an
allergy or asthma. The present sequence is human TNFR-6alpha cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel nucleic acid molecules comprising a polynucleotide encoding humar tumor necrosis factor receptor (TNFR)-6alpha and 6beta polypeptides useful for treating disease e.g. inflammatory and autoimmune disorders

modified polylinker; Site_1: EcoR I; Site_2: Not I;
UT-E-EO1 is a normalized CDNA library containing the
following tissue(e): fetal eye. The library was
constructed according to Bonaldo, Lennon and Soares,
Genome Research, 6:791-806, 1996. First strand cDNA
synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is CGCGTATACC. This library was created for the program, Ger Discovery in the Visual System, supported by National Eye
                                                                                                                                                                                                                                                                                                                                /clone="UI-E-EO1-ajc-j-12-0-UI"

/clone="IMAGE:6250691"
/clone=in="MAGE:6250691"
/clone=in="MIH MGC 110"
/tissue_type="ductal carcinoma, cell line"
/tlab_hofe="MIH MG (Plage resistant)"
/note="Organ: pancreas; Vector: pOTFD; Site_1: XhoI;
Site_2: EcoRI; cDNA made by oligo-dT priming.
Directionally cloned into EcoRI/XhoI sites using the Directionals, adaptor: GGCACGAG(G). Library constructed by Ling Hong in the laboratory of Gerald M. Rubin (University of California, Berkeley) using ZAP-cDNA synthesis kit (Stratagene) and Superscript II RT (Life Technologies).
Note: this is a NIH MGC Library " lothers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mRNA sequence.
/note="Organ: Stomach; Vector: pCNS; Site_1: EcoRI; Site_2: NotI; The poly (A) + RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including EcoR I site by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The cDNA vector was circularized with E. coli DNA ligase after digestion of EcoRI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation method. The cDNA libraries constructed by this method are full-length enriched cDNA library. After analyzing and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequencing about 2,000 ~ 3,000 colonies in original cDNA library, the abundant cDNAs were selected and amplified by PCR reaction using vector region primer including T7 promotor as 5 primer and N(dT)14 as 3 primer. The PCR products were used as template for synthesis of biotinylated single stranded RNA by in vitro transcription reaction. The synthesized RNA probes were hybridized with antisense single stranded cDNAs prepared from original liberary and incubated with avidin-gel. After removing DNA-RNA hybrids by centrifuge, the subtracted cDNA libraries were constructed by transformation of the remaining DNA into competent cells E. coli Top10F' with electroporation method."

The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT773-Pac vector. The oligonuclectide containing a Not I site.
                                                                                                                                                                                                                                                                                                            TAG_LIB=UI-H-DT1

US-08-974-186-1
US-08-974-186
; Sequence 1, Application US/08974186
; Patent No. 6284740
; GENERAL INFORMATION:
 APPLICANT: Boyle, Willaim J.
 APPLICANT: Lacey, David L.
 APPLICANT: Calzone, Frank J.
 APPLICANT: Chang, Ming-Shi
 TITLE OF INVENTION: OSTEOPROTEGERIN
 NUMBER OF SEQUENCES: 53
; CORRESSE: Amgen Inc.
 STREET: 1840 Dehavilland Drive
 CITY: Thousand Oaks
 STATE: California
 COUNTRY: USA
 ZIP: 91320-1789
; COMPUTER READABLE FORM:
 MEDIUM TYPE: Floppy disk
 COMPUTER: IBM PC Compatible
 OPERATING SYSTEM: PC-DOS/MS-DOS
 SOFTWARE: Patentin Release #1.0, Version #1.30
